CSFB is a technology devised to allow Voice and SMS services to travel over LTE (packet-based all-IP) networks, which cannot normally handle circuit switched services. So, when a LTE device is used to place a voice call or send SMS, the device "falls back" to the 3G or 2G network to complete the call or to deliver the SMS. During such a call scenario, the UE changes its radio access technology from LTE to a 2G/3G technology that supports circuit-switched services. A new interface (called SGs) between the MME and the MSC is required.

GL’s Message Automation & Protocol Simulation (MAPS™) SGs Emulator is designed to realize the CS fallback function for Voice and SMS delivery via the Circuit Switched (CS) core network using SGs interface between the Mobility Management Entity (MME) in the Evolved Packet System (EPS) and the Visitor Location Register (VLR), as defined in 3GPP TS 29.118 specifications (SGsAP) SGs interface.

Coming soon is the MAPS™ SGs emulator integration with GL’s multi-protocol and multi-interface lab test solution, covering entire 2G, 3G, and 4G networks simulating CSFB over SGs interface between LTE MME and UTRAN MSC.

For more information on MAPS™ LTE SGs, refer to [http://www.gl.com/test-sms-cs-fallback-over-sgs-interface.html](http://www.gl.com/test-sms-cs-fallback-over-sgs-interface.html)
Testbed Configuration

The testbed setup window allows users to setup the required test environment with SCTP configuration in SGs interface.

SCTP Configuration parameters consists of source / destination IP address, port, including stream id, payload id to configure MAPS™ to simulate MME and MSC/VLR entities in SGs interface. MAPS™ can then generate and receive SGsAP/NAS messages to/from valid IP Address in the LTE network.

End user configuration profile used to configure MAPS™ LTE SGs with supported MSC/VLR and MME parameters.

Pre-processing Tools

**MESSAGE EDITOR** - With message editor, users can build a template for each protocol message type. The value for each field may be changed in the message template prior to testing. The protocol fields comprises of mandatory fixed parameters, mandatory variable parameters, & optional variable parameters.

**SCRIPT EDITOR** - The script editor allows the user to create / edit scripts and access protocol fields as variables for the message template parameters. The script uses pre-defined message templates to perform send and receive actions.

**PROFILE EDITOR** - This feature allows loading profile to edit the values of the variables using GUI, replacing the original value of the variables in the message template. An XML file defines a set of multiple profiles with varying parameter values that allow users to configure call instances in call generation and to receive calls. Includes Location Update type and Identifiers, Mobile ID, IMSI, Detach Service Type settings, and SMS parameter settings required for various SGs interface simulation.

**Call Generation and Call Reception**

In call generation, MAPS™ is configured for the outgoing messages, while in call receive mode, it is configured to respond to incoming messages. Tests can be configured to run once, multiple iterations and continuously. Also, allows users to create multiple entries using quick configuration feature.

The editor allows to run the added scripts sequentially (order in which the scripts are added in the window) or randomly (any script from the list of added script as per the call flow requirements).

The test scripts are started manually at call generation; and at the call reception, the script is automatically triggered by incoming messages.

The screen below is the MAPS™ SGS Emulator configured as VLR receiving and processing the MME-initiated procedures such as Location Updates or Detaches.

**Typical LTE SGs Interface Procedures**

**Location Update for Non-EPS Services**

The location update for non-EPS services procedure is a general procedure used by UEs which are configured to use CS fallback over SGs. The location update procedures in the SGs interface is always started as a consequence of a direct action from the UEs, combined with attach and tracking area update procedures as per the specification.

**End-to-End SMS Procedure**

The below end-to-end call diagram depicts typical mobile originating SMS service from UE1 and mobile terminating SMS service initiation from the network towards UE2.

During SMS over SGs procedure, LTE UE device sends and retrieves CS based SMS messages between MSC and MME.
